

Team 35 - Sprint 2 Retrospective

What went well?

Teamwork and collaborative work was done very well during this sprint. There were little to no issues with working collaboratively on code and this was due to effective communication between team members, holding extra meetings if needed. Aside from this, the user stories written were effective, clear and specific such that it was easily understood by all members and the scope was achievable as well therefore team members were not overly stressed.

What could have been done better?

Keeping on track of other member's progress as well as others. During this sprint, although individual members were on top of their individual tasks at hand, there was a lack of communication regarding other member's tasks, their progress and updates. As certain tasks require multiple people working on similar tasks, progress or changes is important for all members to be on the same page and create misunderstanding and confusion. The project could also include test cases to verify and ensure implemented features work as intended and to better meet the definition of done.

What will we try next?

Improving communication between team members. During stand up meetings as well on communication platforms, individual members will report their progress on their tasks as well as any changes that were made to ensure all team members are on the same page of their functionality and usage for all components of the widget application. Since our definition of done includes the passing of test cases, we need to try adding test cases for each feature next time.

What questions do we have?

What other calculation user stories can we include?
